4	WEST OF CLAIM LANGUAGER BETTER	ASSESSED CEATMORANT PRINCEMENT OF THE PRINCE
-	157.	Infringing Product: Microsoft's Windows File Protection and System File Checker features,
5	-	embodied in Microsoft's Windows 2000,
6		Windows XP products, and Server 2003
	A virtual distribution environment comprising	' N' 6 N' 1 2000
7	(a) a first host processing environment comprising	computer running Microsoft Windows 2000 or Windows XP.
8		
9	(1) a central processing unit;	CPU of computer
10	(2) main memory operatively connected to said central processing unit;	main memory of computer
11	(3) mass storage operatively connected to said central processing unit and said	hard disk or other mass storage contained in computer
12	main memory; (b) said mass storage storing tamper resistant	Windows File Protection process/service
13	software designed to be loaded into said	("WFP") and System File Checker (SFC.exe)
14	main memory and executed by said central processing unit, said tamper resistant	features of winlogon.exe. Winlogon.exe is treated as a "critical" service by the Windows
15	software comprising:	operating system. Files supporting WFP (including winlogon.exe, sfc.exe, sfc.dll (2000)
16		only), sfcfiles.dll (2000 only) and sfc_os.dll (XP only)) are "protected" files and are signed
17	·	using a signature verified by a hidden key. In Windows 2000, WFP uses hidden functions
18		within the sfc.dll library. Functions are imported by "ordinal" instead of "name."
	(1) machine check programming which	Winlogon either directly or using another dll
19	derives information from one or more aspects of said host processing	(XP) or using SFC.dll (2000) determines if changed file was protected, computes the hash
20	environment,	of protected files and, if necessary, computes the hash of the file in the dll cache before using
21		it to replace a file overwritten by an incorrect version of the file.
22	(2) one or more storage locations storing said information;	hardware information is stored in the computer's memory
23	(3) integrity programming which	
	(i) causes said machine check programming to derive said	Windows notifies Winlogon when there has been a system directory change or a change in
24	information,	the dll cache.
25		
26	(ii) compares said information to information previously stored	Winlogon either directly or using another dll (XP) or using SFC.dll (2000) compares
27	in said one or more storage	computed hash with hash in the hash database
28	locations, and	created from the Catalog file(s), and, if there is a difference, compares the hash of the file in
		the dll cache to the hash database created from

Exhibit B

1

2

	1		
1			the Catalog file(s) before using it to replace an overwritten file.
2	<b> </b>	(iii) generates an indication	An event is written to the Event Viewer if
3		based on the result of said comparison; and	hashes do not agree.
4		(4) programming which takes one or more actions based on the state of sain	Depending on the circumstances, WFP displays several messages to the user,
5		indication;	including prompting the user to contact the system administrator, and to insert a CD-ROM.
6		(i) said one or more actions including displaying a messag	See above. Messages also constitute viewable
7	ļ	to the user.	Event Property pop-ups.

5	6.	Product Infringing: XBox
6	A process comprising the following steps:	The process constitutes assembly and use of components making up an XBox game.
	accessing a first record containing information directly or indirectly	The first record consists of the second file table on an XBox DVD. This table
7	identifying one or more elements of a first	identifies the .xbe file which includes the
8	component assembly,	game information.
9	at least one of said elements including at	The xbe file includes executable
10	least some executable programming,	programming.
11	at least one of said elements constituting a	The xbe file is a load module.
12	load module,	
13	said load module including executable programming and a header;	The xbe file includes a header.
14	at least a portion of said header is a public portion which is characterized by a relatively lower level of security	Most information the xbe header is not obfuscated.
15	protection; and	TT
16	at least a portion of said header is a private portion which is characterized, at least some of the time, by a level of security	The entry point address and the kernel image thunk address listed in the xbe header are obfuscated and therefore at a
17 18	protection which is relatively higher than said relatively lower level of security protection,	higher level of security protection.
19	using said information to identify and locate said one or more elements;	The second file table identifies the .xbe file, including where that file is located.
20	accessing said located one or more elements;	The .xbe file is accessed by the XBox.
21	securely assembling said one or more elements to form at least a portion of said	At runtime, the .xbe file is assembled with
22	first component assembly;	form a component assembly. Security associated with this assembling process
23   24		includes verifying signatures associated with portions of the .xbe file, and replacing
25		obfuscated calls to operating system services with actual addresses.
26		The assembly may also include patch files downloaded from a remote server.
27		downhoaded from a remote server.
28		
20	executing at least some of said executable	Game play requires execution of the
- 1	I	

	·	
1	programming; and	assembled programming.
2	checking said record for validity prior to performing said executing step.	The second file table is protected by a digital signature, and is not loaded/used
3		unless the digital signature is verified against the file.
· 4		
5	7. A process as in claim 6 in which:	
١	said relatively lower level of security	The header is protected by the techniques
6	protection comprises storing said public	protecting the xbe such as signing and
ا	header portion in an unencrypted state; and	security descriptors, but it is not encrypted
7		except as noted below.
	said relatively higher level of security	The entry point address and the kernel
8	protection comprises storing said private	image thunk address listed in the xbe
	header portion in an encrypted state.	header are obfuscated. The Xbox SDK's
9	•	(XDK) image build uses a key value shared
		with the retail XBox to perform two XOR operations against the addresses
10		Operations against the addresses

5	CANAL GUALDING CONTROL OF THE STATE OF THE S	GUAIMIOFINFRINGEMENTS
	8.	Products infringing include Windows Installer SDK, and products that include the Windows
6		Installer technology.
7	A process comprising the following steps:	Scenario 1: use of Windows Installer packages (i.e. MSI files) to create Windows Installer-
8		enabled applications, such as Office 2000 and used of the WI service to install them.
ġ		Scenario 2: software distribution technologies
10		that use the Windows Installer OS service for installation, such as Internet Component
11		Download and products like Office Web Components.
		Either scenario can be used by SMS, IntelliMirror and third party tools like
12	·	InstallShield and WISE.  NT or later operating systems (because they
13		use the subsystem identifier)
14	·	using cabinet files, .CAB, (because they have a manifest and INF and/or OSD files), and
15		have been signed with a digital signature and will be authenticated by Authenticode or
16		WinVerifyTrust API and contain at least one PE (portable executables)
17		
18	(a) accessing a first record containing	Scenario 1: First record is the .MSI file that
19	information directly or indirectly identifying one or more elements of a first component	contains information on what goes in the assembly and how to install the assembly.
20	assembly,	Scenario 2:
21		A. First record is the cabinet manifest (indirect instructions)
22		B. Or, First record can be INF and/or OSD
23		files (direct instructions)
24	(1) at least one of said elements	Both scenarios: The PE (portable executable)
25	including at least some executable programming,	in the cabinet file is the executable programming.
25		
27	(2) at least one of said elements constituting a load module,	Both scenarios: PE is a load module:
28	(i) said load module including executable programming and a	Both scenarios: The PE has several headers.

Exhibit B

	:
header;	
(ii) said header including an execution space identifier identifying at least one aspect of an execution space required for use and/or execution of the load module associated with said header;	Both scenarios: SUBSYTEM is a field in the PE Optional Header that is an execution space
(iii) said execution space identifier provides the capability for distinguishing between execution spaces providing a higher level of security and execution spaces providing a lower level of security;	Both scenarios: SUBSYSTEM distinguishes between programs that can run in kernel mode and those that can run in user mode. This is a key security concept of process separation that was introduced with Windows NT.  The Subsystem field in the PE header is used by the system to indicate whether the executable will run within Ring 3 (user mode) or use Ring 0 (native or kernel mode). Anything running in Ring 3 is limited to its own processing space. Executables running in Ring 0 can reach out to other spaces and have security measure built around them.
(b) using said information to identify and locate said one or more elements;	Scenario 1: the MSI file identifies and locates the elements  Scenario 2: .CAB manifest is used to identify Physical location OSD and/or INF is used to identify Logical location
(c) accessing said located one or more elements;	Scenario 1: Using the MSI file  Scenario 2: Using INF and/or OSD in cabinet file
(d) securely assembling said one or more elements to form at least a portion of said first component assembly;	Both scenarios: Using the Window Installer OS service with various properties and flags or the settings for higher protection.  Windows Installer has numerous flags that the developer can set to indicate how the assembly will be installed, in what privilege level, with how much user interface, and how much ability the user has to watch or change what is occurring. These controls have been strengthened with each release of Windows Installer. Windows Installer 1.1 and later has the ability to limit the users capabilities during
	(ii) said header including an execution space identifier identifying at least one aspect of an execution space required for use and/or execution of the load module associated with said header;  (iii) said execution space identifier provides the capability for distinguishing between execution spaces providing a higher level of security and execution spaces providing a lower level of security;  (b) using said information to identify and locate said one or more elements;  (c) accessing said located one or more elements;

environment and later, using the Group Policybased Change and Configuration Management, 2 the administrator has the most control 3 Fields that can be set by the developer or administrator to control what users can do include the following: Transformssecure can be set to a value of 1 5 to inform the installer that transforms are to be cached locally on the user's computer in a location the user does not have write access. (Transforms create custom installations from a 7 basic generic installation, for example to make the Finance versions different from the 8 Marketing version or English versions different from Japanese versions.) 9 AllowLockdownBrowse and DisableBrowse can prevent users from browsing to the 10 sources. SourceList can be used to specify the only 11 allowable source to be used for the installation of a given component. 12 Environment can be used to specify whether the installation can be done while the user is 13 logged on or only when no user is logged on. Security Summary Property conveys whether 14 a package can be opened as read-only or with no restriction. 15 Privileged Property is used by developers of installer packages to make the installation 16 conditional upon system policy, the user being an administrator, or assignment by an 17 administrator. Restricted Public Properties can be set as 18 variables for an installation. "For managed installations, the package author may need to 19 limit which public properties are passed to the server side and can be changed by a user that is 20 not a system administrator. Some are commonly necessary to maintain a secure 21 environment when the installation requires the installer use elevated privileges. " 22 SecureCustomProperties can be created by the author of an installation package to add 23 controls beyond the default list. MsiSetInternalUI specifies the level of user 24 interface from none to full. A Sequence Table can be used to specify the 25 required order of execution for the installation process. There are three modes, one of which is 26 the Administrative Installation that is used by the network administrator to assign and install 27 applications. InstallServicesAction registers a service for 28 the system and it can only be used if the user is

•	·	
1		an administrator or has elevated privileges with
2		permission to install services or that the application is part of a managed installation.
3		DisableMedia system policy disables media
4		sources and disables browsing to media sources. It can be used with DisableBrowse to
4		secure installations version 1.1 that doesn't
5	,	have some of the other capabilities.  AlwaysInstallElevated can be set per user or
6		per machine and is used to install managed
		applications with elevated privileges.  AllowLockdownBrowse,
7		AllowLockdownMedia and
. 8		AllowLockdownPatch set these capabilities so they can only be performed by an administrator
9.		during an elevated installation.
		[See article "HowTo: Configure Windows Installer for Maximum Security (Q247528).
10		
11		Windows XP Professional and .NET have the additional capability to set Software Restriction
12		Policies and have these used by Windows
		Installer.
13	·	In addition, most of the software distribution
14		technologies that use Windows Installer also add a layer of their own controls. For example,
15		SMS 2.0 enables the administrators to control
		the installation is optional or required and whether the user can affect the installation
16		contents/features at all.
17	(e) executing at least some of said executable programming; and	Both scenarios: Part of executable is called during installation in order to do self-
18	programming, and	registration or perform custom actions. The
		overall executable is used at runtime.
19		
20	(f) checking said record for validity prior to	Scenario 1: Sign the overall package and the cabinet files.
21	performing said executing step.	
22	·	Scenario 2: The cabinet file is signed.
·		For IE with the default security level or higher,
23		the digital signature is verified by Authenticode or a similar utility before the
24		component is allowed to be assembled.
25

Systems that support device driver signature technology

Product Infringing: Microsoft Operating

The driver package's INF is a data structure. The INF contains multiple types of sections, structured as hierarchy /"branches," that the Windows operating system or its Plug and Play and/or Set-up installation services "branch" through based on the operating system information and device for which a driver is to be installed. The installation services use the "branching" structure (format) to determine what files should be installed. The INF, further provides disk location information and file directory path information for the files identified as necessary as a result of the "branching" process.

The driver package is a "rights management" data structure based on the fact that it is governed and based on the fact that it processes governed information.

#### Rights Management as Governed Item

A driver manufacturer can include rules governing the driver's installation and/or use in the driver's INF file. For example:

Security entries specify an access control list for the driver.

Driver developers can specify rules that determine behavior of the driver package based on the user's operating system version, including product type and suite and the device for which the driver is to be installed

Rules specifying logging

Local administrators can establish policy as to what action or notification should occur in the event that a driver being installed is not signed.

_		
2 3		The operating system installation services have a ranking criteria it follows when multiple drivers are available for a newly detected device. The criterion is used to determine the driver best suited for ensuring compatibility with the operating
5		system and ensuring functionality of the device.
6	·	Drivers have been certified to be compatible with specified operating system
7.		versions for their respective device classes.  The catalog file protects the integrity of the driver.
8.		Microsoft distributes the Driver Protection
9		List to prevent known bad deriver from being installed.
11		Processing Rights Managed Items
12	·	Certain drivers (SAP) have been explicitly certified to protect DRM content.
13		MSDN – DRM Overview
14 15		A DRM-compliant driver must prevent unauthorized copying while digital content
16		is being played. In addition, the driver must disable all digital outputs that can transmit the content over a standard interface (such
17		as S/PDIF) through which the decrypted content can be captured.
18	said representation including:	
19 20	element information contained within said first rights management data structure; and	A driver that is typically a dynamic-link library with the .sys filename extension.
21	·	An INF file containing information that the system Setup components use to install support for the device.
22		A driver catalog file containing the digital signature.
23		One or more optional co-installers which are a Win32® DLL that assists in device
24		installation NT-based operating systems. Other files, such as a device installation
25		application, a device icon, and so forth.
26		XP DDK – INF Version Section
27		The LayoutFile entry specifies one or more additional system-supplied INF files that
28		contain layout information on the source media required for installing the software
	·	

ď		· ·
2		described in this INF. All system-supplied INF files specify this entry.
. 3		The CatalogFile entry specifies a catalog
		(.cat) file to be included on the distribution media of a device/driver.
4	organization information regarding	Within an INF is a hierarchy with the top being a list of manufacturers, and sub-lists
. 5	the organization of said elements within said first rights management	of models and at the bottom a list of install
6	data structure; and	information by model.
7		For Windows XP and later versions of NT- based operating systems, entries in the
. 8		Manufacturer section can be decorated to specify operating system versions. The
9		specified versions indicate OS versions with which the specified INF <i>Models</i>
10		sections will be used. If no versions are
11		specified, Setup uses the specified <i>Models</i> section for all versions of all operating
12		systems.
		INF's SourceDisksNames and SourceDisksFiles sections specify
13		organization information.
14		XP DDK Source Media for INFs The methods you should use to specify
15	·	source media for device files depend on whether your INFs ship separately from the
16		operating system or are included with the operating system.
17		INFs for drivers that are delivered separately from the operating system
18		specify where the files are located using SourceDisksNames and SourceDisksFiles
19	٠.	sections.
20		If the files to support the device are included with the operating system, the
21		INF must specify a LayoutFile entry in the Version section of the file. Such an entry
		specifies where the files reside on the operating system media. An INF that
22	·	specifies a LayoutFile entry must not include SourceDisksNames and
23		SourceDisksFiles sections.
24		XP DDK - INF SourceDisksNames Section
25		A SourceDisksNames section identifies the distribution disks or CD-ROM discs
26		that contain the source files to be
27		transferred to the target machine during installation. Relevant values of an entry in
1		the INF include: diskid Specifies a source disk.
28		disk-description - Describes the contents

_		
1		and/or purpose of the disk identified by
2		diskid. tag-or-cab-file This optional value
3	,	specifies the name of a tag file or cabinet file.
4		supplied on the distribution disk, either in the installation root or in the subdirectory
		specified by path, if any.  path This optional value specifies the
5		path to the directory on the distribution
6		disk containing source files. The path is relative to the installation root and is
7		expressed as \dirname1\dirname2 and so
		forth.  flags For Windows XP and later, setting
8	·	this to 0x10 forces Setup to use cab-or-tag-
9		file as a cabinet file name, and to use tag- file as a tag file name. Otherwise, flags is
10	·	for internal use only.
11		tag-file For Windows XP and later, if flags is set to 0x10, this optional value
·	•	specifies the name of a tag file supplied on the distribution medium, either in the
12		installation root or in the subdirectory
13		specified by <i>path</i> . The value should specify the file name and extension without path
14		information.
15		XP DDK INF SourceDisksFiles Section A SourceDisksFiles section names the
		source files used during installation, identifies the source disks (or CD-ROM
16	,	discs) that contain those files, and provides
17		the path to the subdirectories, if any, on the distribution disks containing individual
18		files. Relevant values in an entry in the
19		INF would include:   filename Specifies the name of the file on
		the source disk.  diskid Specifies the integer identifying
20		the source disk that contains the file. This
21		value and the initial path to the subdir(ectory), if any, containing the
22		named file must be defined in a
23		SourceDisksNames section of the same INF.
	·	subdir This optional value specifies the subdirectory (relative to the
24		SourceDisksNames path specification, if
25		any) on the source disk where the named file resides.
26	information relating to metadata, said	
27	metadata including: metadata rules used at least in part to	The driver manufacture can specify rules in
	govern at least one aspect of use and/or	the INF that govern the installation and/or
28	display of content stored within a rights management data structure,	use of the driver. For example, security entries specify an access control list for the

driver. Driver developers can specify rules in an INF file that determines behavior of the driver package based on the user's operating system version, including product type and suite. Also, rules related to logging can be specified as mentioned in next claim element.

## For Example - Access Control List Rules

XP DDK - Tightening File-Open Security in a Device INF File

For Microsoft Windows 2000 and later, Microsoft tightened file-open security in the class installer INFs for certain device classes, including CDROM, DiskDrive, FDC, FloppyDisk, HDC, and SCSIAdapter.

If you are unsure whether the class installer for your device has tightened security on file opens, you should tighten security by using the device's INF file to assign a value to the DeviceCharacteristics value name in the registry. Do this within an addregistry-section, which is specified using the INF AddReg directive.

XP-DDK -- INF AddReg Directive

An INF can also contain one or more optional add-registry-section.security sections, each specifying a security descriptor that will be applied to all registry values described within a named add-registry-section.

A Security entry specifies a security descriptor for the device. The security-descriptor-string is a string with tokens to indicate the DACL (D:) security component. A class-installer INF can specify a security descriptor for a device class. A device INF can specify a security descriptor for an individual device, overriding the security for the class. If the class and/or device INF specifies a security-descriptor-string, the PnP Manager propagates the descriptor to all the device objects for a device, including the FDO, filter DOs, and the PDO.

For Example – Operating System Versioning

Operating-System Versioning for Drivers

		•
1		under Windows XP
2		Setup selects the [Models] section to use based on the following rules:
		If the INF contains [Models] sections for
5		several major or minor operating system version numbers, Setup uses the section
6		with the highest version numbers that are not higher than the operating system version on which the installation is taking
7		place.
8	· .	If the INF [Models] sections that match the operating system version also include
. 9		product type decorations, product suite decorations, or both, then Setup selects the
10		section that most closely matches the running operating system.
11	said metadata rules including at least one rule specifying that information	The AddService directive can set up event-logging services for drivers.
12	relating to at least one use or display of said content be recorded and/or	INF AddService Directive An AddService directive is used to control
13	reported.	how (and when) the services of particular Windows 2000 or later device's drivers are
14		loaded, any dependencies on other underlying legacy drivers or services, and
15		so forth. Optionally, this directive sets up
16		event-logging services by the devices/drivers as well.
17	·	Relevant sections of the directive's entry include:
18	·	event-log-install-section -Optionally references an INF-writer-defined section in
•		which event-logging services for this device (or devices) are set up.
19 20	·	EventLogType Optionally specifies one of System, Security, or Application. If
21		omitted, this defaults to System, which is almost always the appropriate value for the
22		installation of device drivers. For example, an INF would specify Security only if the
23		to-be-installed driver provides its own security support.  EventName Optionally specifies a name
24		to use for the event log. If omitted, this defaults to the given ServiceName.
25		, consume to the Brown and the Brown and
26		
27	35. A descriptive data structure as in claim 34, in which:	
28	said first rights management data structure comprises a first secure container.	The driver package is secured through a catalog file that is signed by Microsoft's
	·	Windows Hardware Quality Lab and

18		
19		

CLAIM LANGUAGE 26	CLAIM OF INFRINGEMENT
58.	Product Infringing: Microsoft .NET Framework, Visual Studio .NET, and tools that include the Assembly Generator tool AL.exe.
A method of creating a first secure container, said method including the following steps;	The Assembly Generation tool generates a portable execution file with an assembly manifest from one or more files that are either Microsoft intermediate language (MSIL) modules or resource files. When using the tool's signing option, the assembly becomes a secure container.
(a) accessing a descriptive data structure, said descriptive data structure including or addressing	The descriptive data structure is the text file used as input by the Assembly Generation tool.
(1) organization information at least in part describing a required or desired organization of a content section of said first secure container, and	The DDS specifies the link and or embed directives to indicate which source files should be included in the assembly, how the included resource will be tagged, and if the resource will be private. Private resources are not visible to other assemblies.  These tags are used to organize the assembly into named sections.  Private attributes are used to organize the assembly into both public and private sections. (Public sections are the default.)
(2) metadata information at least in part specifying at least one step required or desired in creation of said first secure container;	The text file can contain "options" relating to how the assembly should be built and additional information that should be included.
	Main – Specifies the method to use as an entry point when converting a module to an executable file.  Algid – Specifies an algorithm to hash all files.  Comp – Specifies string for the Company field.  Conf – Specifies string for Configuration field  Copy – Specifies string for Copyright field.  Culture – Specifies the culture string to associate with the assembly.  Delay – Variation of this option

1				·
2				fully or partially signed and whether the public key is placed in the assembly.  Description – Specifies the description field.
				Evidence – Embeds file in the assembly with the resource name
4		l		Security. Evidence.
5			•	Fileversion - Specifies the file version
			•	of the assembly.  Flags – Specifies flags for such things
6				as the assembly is side-by-side
7				compatible, assembly cannot execute with other versions if either they are
8	∦.			executing in the same application
. 0		<b> </b> .		domain, process or computer.  Keyf - Specifies a file that contains a
. 9				key or key pair to sign an assembly.
10	∦ .			Keyn - Specifies the container that holds
11			•	a key pair.  Product - Specifies string for Product
1.1			•	field.
12				Producty – Specifies string for Product Version.
13.	1			Template - Specifies the assembly fro
14				which to inherit all assembly metadata.  Title - Specifies string for Title field.
14				Trade – Specifics string for Trademark
15				field.
16		(b)	using said descriptive data structure to	V - Specifies version information.  The following directives are used to specify
			organize said first secure container	which files are to be compiled into the
17			contents	assembly, how they will be tagged, and whether or not they will be visible to other
18			,	assemblies, AKA private:
19				Embed[name, private] - copies the
20				content of the file into the assembly and applies an optional name tag, and
20				optional private attribute.
21				Link[name, private] - file becomes part
22				of the assembly via a link and applies an optional name tag, and optional private
				attribute.
23		(c)		The following are some of the "options" address what information should be
24			least in part determine specific information required to be included in	included in the secure container:
25			said first secure container contents;	Main - Specifies the mathod to was as
25			and	Main – Specifies the method to use as an entry point when converting a
26			·	module to an executable file.
27				Comp – Specifies string for the Company field.
27				Conf – Specifies string for
28				Configuration field

٥	CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
<b>4 5</b>	1.	Products infringing: All products that include the Common Language Runtime or Compact Common Language Runtime or Common Language Infrastructure.
6	A method for using at least one resource	Resource may constitute a Microsoft Windows
7	processed in a secure operating environment at a first appliance, said method comprising:	process or hardware element; secure operating environment is Microsoft Common Language
.8		Runtime ("CLR") environment, Common Language Infrastructure ("CLI") or Compact
9		CLR ("CCLR"); first appliance is computer running CLR, CLI or Compact CLR. Two
10		infringing scenarios are set forth herein: (1) For CLR, an administrator, using the .NET
11		framework caspol exe tool remotely configures security policy in a .NET configuration file for
12		a machine, enterprise, user, or application and that security policy interacts with rules or
13		evidence declared in a shared assembly provided by another entity ("1st scenario"); and
14		(2) for CLR, CLI and CCLR two assemblies are delivered to an appliance; the first
15	·. ·	assembly has a rule that demands permissions from a caller in the second assembly, and the
16		second assembly includes a control that asserts such permissions or provides evidence that
	·	convinces the runtime that it has such permissions. ("2 <sup>nd</sup> scenario"). In each scenario
17		Microsoft .NET "Code Access Security" framework or "Role Based Security"
18		framework is used.
19	(a) securely receiving a first entity's control at	1 <sup>st</sup> scenario: first entity is the administrator,
20	said first appliance, said first entity being located remotely from said operating	and the policy that constitutes this entity's control is securely received at the first
21	environment and said first appliance;	appliance through a session established between the administrator's computer and the
22		first appliance, requiring security credentials such as the administrator's login and password
23		or other secure session means.  2 <sup>nd</sup> scenario: first entity is creator or distributor
24	, which was the same of the sa	of the first assembly, assembly manifest includes a control demanding or refusing or
25		otherwise asserting a security action on permissions from a caller; first assembly is
26		integrity-checked.
27	(b) securely receiving a second entity's control at said first appliance, said second entity being	Second entity's control is contained in shared assembly manifest (and therefore integrity
	located remotely from said operating	protected) that provides evidence for obtaining permissions, or asserts permissions; assembly
28	environment and said first appliance, said second entity being different from said first	creator/distributor is located remotely and is
į		

1	entity; and	not the administrator (1 <sup>st</sup> scenario) or
2		creator/distributor of the first container (2 <sup>nd</sup> scenario);
3	(c) securely processing a data item at said first appliance, using at least one resource,	Secure processing is carried out by CLR, CLI or CCLR, Data item constitutes an executable
4	including securely applying, at said first appliance through use of said at least one	an executable, a data collection or stream (such
5	resource said first entity's control and said second entity's control to govern use of said	as media file or stream or text file) or an environment variable. CLR, CLI or CCLR securely processes the rules, which will in both
6	data item.	scenarios govern access to methods and data
7		from the first assembly. The resource named in the claim is, e.g., a Windows process that is
8		established by the runtime or hardware element on the computer.
9	51. A method as in claim 1 wherein at least said secure processing step is performed at an	Consumer computer or appliance running Microsoft CLR, CLI or CCLR).
10	end user electronic appliance.	
11	58. A method as in claim 1 wherein the step of securely receiving a first entity's control	1 <sup>st</sup> scenario 1: link is LAN or WAN; 2 <sup>nd</sup> scenario: link is any telecommunications link,
12	comprises securely receiving said first entity's control from a remote location over a	including the internet.
13	telecommunications link, and the step of securely receiving said second entity's control	
14	comprises securely receiving said second entity's control from the same or different	
15	remote location over the same or different telecommunications link.	
16	65. A method as in claim 1 wherein the	Secure processing environment is CLR, CLI or
17	processing step includes processing said first and second controls within the same secure	CCLR running on user's computer or appliance.
18	processing environment.	
19	71. A method as in claim 1 further including the step of securely combining said first	In scenario 2, arrangement consists of the stack frame, and the corresponding array of
20	entity's control and said second entity's control to provide a combined control arrangement.	permission grants for assemblies on the stack, and the permission demanded by the first assembly. Secure combining performed by the
22	76. A method as in claim 1 wherein said two	CLR, CLI or CCLR.  Steps are performed at different times in both
23	securely receiving steps are independently performed at different times.	scenarios.
24	84. A method as in claim 1 wherein at least one of the first entity's control and the second	In both scenarios the second entity supplies an assembly with a demand procedure executed
25	entity's control comprises at least one executable component and at least one data	by the CLR, CLI or CCLR. The data component is a specific attribute value
26	89. A method as in claim 1 wherein said first	referenced by the assembly.  Microsoft Common Language Runtime (CLR),
27	appliance includes a protected processing environment, and wherein:	Common Language Infrastructure (CLI), or Compact Common Language Runtime (CCLR)
28	(a) said method further comprises a step of receiving, at said first appliance, said data item	Typically occurs in both scenarios.

8	(a) securely providing, from a first location	A first signed and licensed .NET
	to a second location, a first data item	component, .NET assembly, managed
9	having at least a first control associated	control and/or Web control (component) is
ĺ	therewith;	the first data item. The first NET
10		component developer (first location) provides the application assembly
		developer (second location) the first
11		component. The first control is the set of
.		declarative statements comprising the
12		LicenseProviderAttribute (alternately
12	•	referred to as license controls).
13	(b) securely providing, from a third	A second signed and licensed component is
14	location to said second location, a second	the second data item. The second
17	data item having at least a second control	component developer (third location)
15	associated therewith;	provides the application assembly
		developer (second location) the second
16		component. The second control is the set
		of declarative statements comprising the LicenseProviderAttribute.
17	(a) family at said assent location a	The application assembly developer will
	(c) forming, at said second location, a composite of said first and second data	include at least the two components into its
18	items;	assembly.
19	(d) securely combining, at said second	At the second location, the application
19	location, said first and second controls to	assembly developer uses the .NET runtime
20	form a control arrangement; and	that includes the LicenseManager.
20	,	
21	. '	Whenever a component is instantiated
		(here, an instance of the first licensed
22		component), the license manager accesses
		the proper validation mechanism for the
23		component. The license controls (first
_		control) for the runtime license (derived from the design time license) are bound
24		into the header of the .NET application
		assembly, along with the second control for
25		the second component.
26		die seedia eomponem
26		Visual Studio.NET securely handles the
27		creation of runtime license controls.
41		Runtime licenses are embedded into (and
28		bound to) the executing application
20		assembly. The license control attribute

Exhibit B

- 1	·	
1	· · · · · · · · · · · · · · · · · · ·	included in the first component is
2		customized in the second location to express and require the runtime license. In
3		a more advanced scenario, the License Complier tool can be used to create a
		"licenses file" containing licenses for
4		multiple components, including runtime
5		licenses for components and classes created by the license provider. This licenses file
6	·	is embedded into the assembly.
7		The third control set comprises the runtime
		license controls for the first and second components (that had been bound to the
8		assembly), the declarative controls
9	·	provided by the application assembly developer, and any runtime licenses for
10		other components included by the
10		developer in application assembly. The
11		controls are typically integrated into the header of the .NET application assembly
12		calling the first licensed component.
	(e) performing at least one operation on said composite of said first and second data	The proper execution of the application will require that the assembly have run
13	items based at least in part on said control	time licenses for the two components.
14	arrangement.

· 4.	L SE CLAIMILANGUAGE	CLAIMOF DERINGEMENT
5		Product Infringing: Windows CE for Automotive
6	1. A security method comprising:	WCEfA is Microsoft Windows CE for Automotive, sometimes also known by its former name, AutoPC 2.0.
7		With WCEfA an OEM can assign their device to a class that only accepts certain kinds of software. The device
8		can be set to accept 1) any software with the correct processor/version 2) only certified software or 3) only software from the OEM or Microsoft. These Security (or
9		Trust) levels also control to which kernel APIs and middleware APIs the software has access.
11		Background: "Microsoft Software Install Manager (SIM), a
12	,	component of WCEfA, allows you to control what can be installed on your device platform. You can define your platform as being open, closed or restricted to new
13 14		installations, and SIM will enforce these designations." (D,pg.1)
15		"Anything can be installed on an open platform, as long as the applications are compiled for the appropriate
16 17		processor. At the other extreme, no third-party software can be installed on a closed platform. Only certified applications can be installed on a restricted platform."
18	·	(D, pg.1)
19		"By restricting installations to compliant applications, the risk of installing and using incompatible or harmful
20		software is greatly reduced, while still keeping the device open for robust, quality applications that enhance the user experience." (F, pg.1)
21		WCEfA also has a Security Layer whose purpose is to "Create an abstraction layer of security surrounding ISV
22   23		applications to limit and/or deny access to key Windows CE kernel API calls and WCEfA middleware APIs." I,
24	·	pg. 1)
25	(a) digitally signing a first load module with a first digital signature designating the first load	A first load module is a WCEfA software component in a signed PE file. The first device class is a device that only allows software designated as "restricted" (or
26	module for use by a first device class;	higher) to be installed. "Restricted" software is software that has been certified. With restricted software, the
27		device also implements a Security Layer functionality that limits the kernel and WCEfA API calls that the
28		software can make.

1

2

2 3 4 5	"SIM Level: 1 = Restricted Description: Only properly certified CEI (WCEfA device installation) files can be installed on the device. Remote execution is restricted to executables with master key. Key: Logo certified CEI file required. CEI files or EXEs with master keys permitted." (F, pg.1)  "The kernel loader calls it each time a module is loaded by Windows CE. It returns one of the following values that determine the module's access to kernel resources:
7 8	Value Meaning
9 10	OEM_CERTIFY_TRUST (2) The module is trusted by the OEM to perform any operation.
11	OEM_CERTIFY_RUN (1) The module is trusted by the OEM to run but is restricted from making certain function calls.
12 13	OEM_CERTIFY_FALSE (0) The module is not allowed to run.
14	"(H, pg. 1)
15 16	Digitally signing: "Before the kernel loads a file, it uses the OEMCertifyModule function to verify that the file contains the proper signature." (N, pg.1)
17	"Signfile.exe: This tool signs an executable with a
18	supplied private key. You can use the following command parameters with this tools AttribString, specifies an optional attribute string to be included in the
19	signature. For example, you could add a string to indicate the trust level of the application." (O. Pg. 1)
20	In the MSDN article Verifying the Signature, the sample
21	code segment states "//the file has a valid signature
22	// we expect the trust level to be returned as signed data
23	//case 'R' : dwTrustLevel = OEM_CERTIFY_RUN" (N, pg.2)
25	
26	"The WCEfA Security Layer isolates installed applications from making unrestricted kernel and WCEfA API calls. This allows the OEM to assign one of three levels of security to applications and drivers
27	installed in RAM when they are loaded into the system.  The three levels are Trusted, Restricted, and
28	BlockedOn the systems level, the WCEfA Security
1	

1		layer fits between ISV applications and isolates these
2		software modules from having free access to all WinCE kernel calls and WCEfA middleware APIs." (I, pg. 1)
3		The developer submits their application for certification. If it passes, then the .cei file (a form of cab file) receives
4		a certification key from the certifier. The signed PE is within this cei file.
5		
6	(b) digitally signing a second load module with a second digital signature different from the	A second load module is a WCEfA software component is a signed PE file. The second device class with a
7	first digital signature, the second digital signature designating the second load module	different tamper resistance or security level is a device that is "Closed", that is, it will not allow third party to
8	for use by a second device class having at least one of tamper resistance and security level	software to be installed. A closed device only allows trusted software to run. The Security Layer setting of
9	different from the at least one of tamper resistance and security level of the first device	"Trusted" allows the Microsoft and OEM software full access to kernel and middleware APIs.
10	class;	In the MSDN article Verifying the Signature, the sample
11	·	code segment states "//the file has a valid signature
12		// we expect the trust level to be returned as signed data
13		//case 'T': dwTrustLevel = OEM_CERTIFY_TRUST" (N, pg.2)
14		"Signfile.exe: This tool signs an executable with a
15		supplied private key. You can use the following command parameters with this tools AttribString, specifies an optional attribute string to be included in the
16 17	·	signature. For example, you could add a string to indicate the trust level of the application. (O. Pg. 1)
		"SIM Level: 2 = Closed
18 19		Description: Platform is limited to software supplied directly by OEM or Microsoft. Third-party applications cannot be installed
20		Key: Master key required for any install or remote execution." (F, pg.1)
21.		Related to the Security Layer, the Trusted level "is most
22		likely reserved for MS and OEM applications and drivers." (I, pg. 1)
23		Whereas the .cei files for certified software have a
24		certification key (sometimes call MS Logo key), the .cei files from Microsoft or the OEM have a master key
25	·	attached. ""Master key required for any install or remote execution." (F, p.g1)
26	(c) distributing the first load module for use by	First load module is the certified software from a third
27	at least one device in the first device class; and	party that will be run as part of the "Restricted" first device class.
28		"Once your application is complete, send the .cei file to

	٨	
1		the organization that is performing validation or
2	·	certification for the OEM. They would validate it, then either reject or return a .cei that has been stamped with a
. 3		certification key. You would then reproduce this .cei file
		on CD-ROM or a compact flash card and distribute." (D, p.g 5)
4		"APCLoad compares the device SIM level against the
5		.cei file certification key, and either allows the
6		installation to proceed or prohibits it based on the outcome of this comparison." (D, pg. 2)
7		
	,	"Security:. To achieve a high level of reliability, WCEfA is carefully designed to:
8		- Control the installation of certified and tested software and drivers.
9		- Limit the access of system services by installed
10		module.  - Monitor the proper execution of software"
11		(G, pg. 1)
12	(d) distributing the second load module for use	The second load module is the certified software from
	by at least one device in the second device class.	the OEM or Microsoft that will be run as part of the "Closed" second device class.
13	ciass.	"You may need to change ROM components after your
14		device ships, either to fix a problem, or to provide
15		enhanced functionality. For this purpose, the OEM is given a CElBuild that adds a master key to a .cei file.
16		CEI files stamped with this master key can be installed
17		on an open, closed or a restricted platform." (D, pg. 3)
		"Trusted: The application is registered as a completely trusted module and allowed full access to the kernel
18		APIs and WCEfA APIs. This mode is mostly likely
19		reserved for MS and OEM applications and drivers.  Note that applications and drivers included in ROM are
20		automatically given trusted status." (I, pg.1)

	Product infringing: Windows Hardware Quality Lab certification services, and operating system products that support
	driver signature technology.
A software verifying method comprising:	Microsoft encourages manufacturers to have their device drivers tested and signed. For example, only signed drivers will ship "in-the-box." Also, Microsoft's driver
	ranking prefers signed drivers to unsigned
	drivers.
	Microsoft Web Page - Can't Find a Test Category for Your Driver?
	WHQL's long-term objective is to be able
	to digitally sign all drivers. Although we do not currently have test programs for certain driver types, such as specialized device
	drivers and software filter drivers, WHQL
	is investigating a long term solution to
	expand the categories of drivers tested under Windows 2000 and ultimately all
	Windows operating systems. We are
	already formulating a test program for anti
•	virus file system filters, and plan to addres other file system filter drivers as soon as
	the initial program is in place.
(a) testing a load module	The driver will be tested for each version of
	the operating system it supports and agains the device class specification that apply to
·	the device's class.
•	The driver meetings is a load module. A
	The driver package is a load module. A driver package contains one or more of the
-	following files:
	A device setup information file (INF file)
•	A driver catalog (.cat) file One or more optional co-installers
	Microsoft operates the Window Hardware
	Quality Lab, which tests drivers submitted by driver manufactures.
	· *
	The manufacturer can test their own drive using the Microsoft testing kit and submit
	the test results to WHQL when requesting
	signature. Additionally, Microsoft or a testing facility working with Microsoft ca
	perform the testing.

Exhibit B

	· ·	
. 1	therewith,	is part of the driver package, is a
2		specification. Microsoft Windows drivers must have an INF file in order to be
3	the specification describing one or more	installed. The INF Version section specifies its
4	functions performed by the load module;	device class. One use of the device class is
5		to identify the specific Windows compatibility specification that relate to the
6		device class. These specifications will vary by device class in part because the function
İ		of each device can vary among class. The INF incorporates by reference the
7		Microsoft supplied device class-specific specification by identifying its class in the
8		INF.
9		The INF can include operating system "decorating" to specify the operating
10 11	·	system architecture, major and minor version, product and suite the driver is
12		intended for and can further use this decorating to specify what operating
		systems for which it is not intended.  Because the functionality of each of the
13		operating systems may vary the driver must be tested for each applicable operating
14		system.
15 16		<u>Qualification Service Policy Guide –</u> <u>Hardware Category Policies</u>
		You must select the correct hardware
17		category for your device. If you select the wrong hardware category for your device,
18		your submission will fail. For example, if you have a storage/hard drive device, but
19		you select storage/tape drive as your
20	·	hardware category, your submission will fail.
21		Windows XP HCT 10.0 Q & A – Windows
22		XP Logos
23		Q: Which "Designed for Windows XP" logos are available for my product?
24.	en en en la companya de la companya de la companya de la companya de la companya de la companya de la companya	A: Devices and systems qualify for a "Designed for Windows" logo after passing
25		testing with the appropriate WHQL test kit on all operating systems specified by the
26		logo. "Designed for Windows" Logos for Device
27		and System Programs lists which logos are available for each type of product.
28	(b) verifying that the load module satisfies the specification; and	The Microsoft WindowsXP Hardware Compatibility Test (HCT) kit version 10.0
20		includes the tests, test documentation, and

		•
1 2 3 4 5		submission processes that are required to participate in the Microsoft Windows Logo Program for Hardware for the Windows XP Professional operating system. To qualify to use the "Designed for Windows" logo for hardware, products must pass testing with the Microsoft Windows HCT kit. The HCT kits are organized by hardware type.
6		As mentioned above, the manufacturer can
7		test their own driver using the Microsoft testing kit and submit the test results to
8		WHQL when requesting a signature.
9		Additionally, Microsoft or a testing facility working with Microsoft can perform the
·	(c) issuing at least one digital certificate	testing. When a driver package passes WHQL
10	attesting to the results of the verifying step.	testing, WHQL generates a separate CAT file containing a hash of the driver binaries
11		and other relevant information. WHQL
12		then digitally signs the CAT file using Digital Signature cryptographic technology
.13		and sends it to the vendor. Driver signing does not change the driver binaries or the
14		INF file submitted for testing.
15		Microsoft uses digital signatures for device drivers to let users know that drivers are
16		compatible with Microsoft Windows XP, Windows 2000, and Windows Me. A
17	·	driver's digital signature indicates that the driver was tested with Windows for
18		compatibility and has not been altered since testing.

Exhibit B 

		!
4	126.	Product Infringing: Windows Hardware
5		Quality Labs Authentication services,
,		Windows operating Systems (such as
6		Windows XP) that support the driver
		signing features, and any product using Driver Signing feature
7	A method of providing trusted intermediary	Driver Signing readure
8	services including the following steps: at a first apparatus, receiving an item from	Microsoft's Window Hardware Quality
9	a second apparatus;	Labs (WHQL) (first apparatus) receiving driver package (item) from independent
		hardware vendor (IHV) or any driver
10		developer (second apparatus).
11	associating authentication information with said item;	The signature information of a security catalog file (see next element of claim)
12	·	names Microsoft as the publisher. WHQL's signature is intended to signify
13	:	that a driver has complied with Microsoft's Windows compatibility and/or Secure
14		Audio Path (SAP) specifications.
•	incorporating said item into a secure digital	The hashes of the files making up the
15	container;	driver package are included in the signed
		security catalog file for the driver package.  The catalog file makes the driver package a
16		secure digital container.
17	associating a first rule with said secure digital container, said first rule at least in	Driver developers specify rules in an INF file that govern the installation and/or use
18	part governing at least one aspect of access to or use of said item;	of the driver. For example, as specified in the INF, the installation events will vary
19		based on the user's operating system version, which includes architecture,
20	·	product type and suite. The INF logging
21	·	rules and can further specify security rules that are evaluated when the driver is used.
		White Paper – Operating-System
22		Versioning for Drivers under Windows XP
23	·	Setup selects the [Models] section to use
24		based on the following rules:
25		If the INF contains [Models] sections for several major or minor operating system
26		version numbers, Setup uses the section with the highest version numbers that are
27		not higher than the operating system
28		version on which the installation is taking place.
		<u> </u>

Exhibit B

1

2

1 2 3 4		If the INF [Models] sections that match the operating system version also include product type decorations, product suite decorations, or both, then Setup selects the section that most closely matches the running operating system.
-		Suppose, for example, Setup is running on
5 6 7	· ·	Windows XP Professional (which is operating system version 5.1), and it finds the following entry in a [Manufacturer] section:
8		%FooCorp%=FooMfg, NT, NT.5, NT.5.5, NT0x80
9	4	In this case, Setup will look for a [Models]
10		section named [FooMfg.NT.5]. Setup will also use the [FooMfg.NT.5] section if it is running on a Datacenter version of
11 12		Windows .NET Server, because a specific major/minor version takes precedence over the product type and suite mask.
13		For example, to create an INF that is
14		intended for use only on Windows XP, the INF file could contain the following:
15		[Manufacturer]
16		"Foo Corp." = FooMfg, NT.5.1, NT.5.2 [FooMfg.NT.5.1] "Foo Device" = FooDev, *FOO1234
17		
18		Note the omission of the undecorated [FooMfg] section, as well as the omission
19		of the [FooMfg.NT.5.2] section. This INF file would appear to be "empty" on any
20		operating system other than Windows XP.
21		Access Control List Rules
22		XP DDK - Tightening File-Open Security in a Device INF File
23		For Microsoft Windows 2000 and later,
		Microsoft tightened file-open security in the class installer INFs for certain device
24		classes, including CDROM, DiskDrive, FDC, FloppyDisk, HDC, and
25		SCSIAdapter.
26		If you are unsure whether the class installer for your device has tightened security on
27		file opens, you should tighten security by using the device's INF file to assign a value
28		to the DeviceCharacteristics value name
20		in the registry. Do this within an add-

	·	·
1		registry-section, which is specified using
2	transmitting said secure digital container	the INF AddReg directive.  Microsoft, IHV, driver developer or any
3	and said first rule to a third apparatus, said third apparatus including a protected	other party distributing signed driver packages transmitting the driver package to
4	processing environment at least in part protecting information stored in said	user (third apparatus). Since the driver package includes the INF file, it will
5	protected processing environment from tampering by a user of said third apparatus;	include the first rule. The protected processing environment (PPE) is Windows
6	tumpering by a abor or said time apparatus,	operating system with its pertinent services such as Windows File Protection, signature
7		and cryptographic functions, Plug and Play and Set-up and their related default and
8		modifiable policies. The PPE checks for signatures on driver packages and detects
. 9 .		situations when the driver package's
10		signature does not match the driver package.
11		Additionally, the Digital Rights Manager (DRM) components (kernel and client) will
12		contribute to making the third apparatus a  PPE when the SAP functionality is
13		invoked. [That is, when SAP is required, an additional signature is checked to verify
14		that the driver is SAP compliant and that it hasn't been tampered with.]
15	said third apparatus receiving said secure digital container and said first rule;	The end-user receiving the driver package.
16	said third apparatus checking said	A step in the Plug and Play/Setup driver installation process checks signature at
17	authentication information; and	installation. Additionally, the DRM component will check the DRM signature
18		when invoking DRM functionality.
19		White Paper - Driver Signing for Windows
20		During driver installation, Windows compares the hashes contained in the driver's CAT file with the computed hash
21 22	·	of the driver binaries to determine whether the binaries have changed since the CAT
	· ·	file was created. If a driver fails the signature check or there is no CAT file,
23		what happens next depends on the driver signing policy in effect on the user's
24		system:
<ul><li>25</li><li>26</li></ul>		If the policy is set to Ignore, the driver installs silently, with no message to the user.
27		If the policy is set to Warn, a message
28		warns the user the driver is unsigned, which means that it has not passed WHQL
ľ		

1		
1		testing and might cause problems. The Warn dialog box gives an administrative
2		user the option to override the warning and
3		install an unsigned driver anyway.
. 4		If the policy is set to Block, the system displays a message that informs the user
5		that the driver cannot be installed because
	said third apparatus performing at least one	it is not digitally signed.  The action would be installing and/or using
6	action on said item, said at least one action	the driver. For example, installation
7	being governed, at least in part, by said first rule and by a second rule resident at	policies govern the actions (ignore, warn or block) taken based on whether a driver is
8	said third apparatus prior to said receipt of	signed or not and these policies (rule) are resident on the third apparatus. Another
. 9	said secure digital container and said first rule, said action governance occurring at	rule is the "ranking" of available drivers
10	least in part in said protected processing environment.	when selecting a driver to install. This ranking process includes whether a driver
	· · · · · · · · · · · · · · · · · · ·	is signed or not. Another rule is the security access rules that the class installer
11	·	that will be used to install the device has.
12		In the case of DRM, the content will have
13		associated rules governing its use in a SAP- complaint environment. These rules (the
14		content license) can be resident at the third
15		apparatus particularly in the case when a user is installing a new (SAP-compliant)
		device that will render previously acquired content or in the case that acquired content
16		cannot be rendered until the user installs
17		required drivers.
18		For example, when installing:
19		The XP driver ranking process and the modifiable default related to signature state
20		of the driver act as the second rule.
21		The driver will be installed only if the first
		and second rules validate.
22		Operating-System Versioning for Drivers
23		under Windows XP
24	·	Default System Policy for Unsigned Drivers
25		If the user installs an unsigned driver for a
26		designated device class from disk or from another web site, Windows XP/Windows
27		2000 displays a warning that the driver is unsigned, thus helping to preserve the
28		integrity of the released system. However,
		by default, Windows XP/Windows 2000

1		
2		does not block installation of unsigned drivers, so vendors can get urgent hot-fixes to customers while waiting for WHQL to test the fix.
, 4. 5		In Windows XP, the default driver signing policy can be changed through the Hardware tab of the System applet on the
6 7		Control Panel. A user can change the policy to be more restrictive, but not less restrictive on a per-user basis (that is, a user can change Warn to Block, but not to
8		Ignore). An administrator can change the policy to be either more restrictive or less restrictive for all users on the system by
9.		checking "Apply the setting as system default."
10		Driver Ranking
11 12		Under Windows XP, the driver ranking strategy has been modified as follows:
13		If an INF file is unsigned, and if neither the [Models] section nor the [DDInstall]
14		section is decorated with an NT-specific extension, the INF file is considered
15 16		"suspect" and its rank is shifted into a higher range (that is, worse) than all hardware and compatible rank matches of
17		INF files for which one (or both) of those criteria are met.
18	·	The new ranking ranges will now be:
19		0 - 0xfff (DRIVER_HARDWAREID RANK):
20		"trusted" hardware-ID match  0x1000 - 0x3FFF: "trusted" compatible-
21		ID match 0x8000 - 0x8FFF: "untrusted" hardware-
22	·	ID match 0x9000 – 0xBFFF: "untrusted"
23	·	compatible-ID match 0xC000 - 0xCFFF : "untrusted"
24	·	undecorated hardware-ID match (possibly a Windows 9x-only driver)
25		0xD000 - 0xFFFF: "untrusted" undecorated compatible-ID match
26		(possibly a Windows 9x-only driver)
27	127. A method as in claim 124 in addition	The earth and a district of the state of the

17		Download
18	,	The holder of the digital certificate
19		Keeping your digital certificate safe is very important. Some firms (including
20		Microsoft) do not keep their signature file on site. The signature is kept with the
21		Certificate Authority and files are sent there for signing.
22		
23	associating authentication information with said item;	Signing the software associates the software publisher's identify with the software.
24		
25		Source: Packaging ActiveX Controls Signing Cabinet Files
26		A .cab file can be digitally signed like an ActiveX control. A digital signature
27		provides accountability for software developers: The signature associates a
		software vendor's name with a given file. A signature is applied to a cab file (or
28	· .	control) using the Microsoft Authenticode®

Exhibit B

1		technology.
2		The .cab tool set assists software developers in applying digital signatures to .cab files by allowing a developer to
3		allocate space in the .cab file for the
, 4	i a contro digital	signature. Signing software either directly or within a
5	incorporating said item into a secure digital container;	package (cabinet or .msi file) secures it in a digital container.
6		Alternately, the signed ActiveX control could be placed into a signed cabinet file.
7	associating a first rule with said secure	The first rule would be the licensing support code within the ActiveX control
8	digital container, said first rule at least in part governing at least one aspect of access	and/or conditional syntax statements when
°	to or use of said item;	the software is within a signed .msi file.
9	the second second second	When the software is within a signed cabinet file, the first rule can be a rule
10		contained in the software, as is the case
1	,	when an ActiveX control is packaged in a signed cabinet file.
11		First rule, in the case of ActiveX:
		When an application with a licensed
13		ActiveX control is started, an instance of
14		the control usually needs to be created. The application accomplishes this by making a call to CreateInstanceLic and
15 16		passing the license key embedded in the application as a parameter in the call. The
17		ActiveX control performs a string comparison between the embedded license
18		key and its own copy of the license key. If the keys match, an instance of the control is
10		created and the application can execute
19		normally.
20		Source: Using ActiveX Controls to
		Automate Your Web Pages Run-time licensing
21		Most ActiveX Controls should support
22		design-time licensing and run-time licensing. (The exception is the control that
23		is distributed free of charge.) Design-time
		licensing ensures that a developer is building his or her application or Web page
24	·	with a legally purchased control; run-time
25		licensing ensures that a user is running an application or displaying a Web page that
26		contains a legally purchased control.
		Design-time licensing is verified by control containers such as Visual Basic, Microsoft
27		Access, or Microsoft Visual InterDev®.
28		Before these containers allow a developer to place a control on a form or Web page.
		TO place a control on a form of web page.

1		they first verify that the control is licensed
2	,	by the developer or content creator. These containers verify that a control is licensed
3		by calling certain functions in the control:  If the license is verified, the developer can
4		add it. Run-time licensing is also an issue for
5		these containers (which are sometimes bundled as part of the final application); the
6		containers again call functions in the control to validate the license that was
7	transmitting said secure digital container	embedded at design time. The third apparatus is a user computer or

0	A method of providing trusted intermediary	•
7	services including the following steps:	Ti it is a second NET accombly:
8	at a first apparatus, receiving an item from a second apparatus;	The item is an unsigned .NET assembly, which can include, but not be limited to, a Web control, multi-file assembly or component. Within the development
0		environment, multiple assembly builders (working on a second apparatus) will send their unsigned assembly to a secure
1		location (first apparatus) containing the entity's private signing key. An example entity would be a software publisher.
2   3		.NET Security Framework - pg 130-1
4		Describes this exact practice and further
5		explains the "Delay Signing Assemblies" feature of .NET that accommodates the fact
6		that "many publishers will keep the private key in a secure location, possibly embedded in specially designed
7		cryptographic hardware."
8		"Delay signing is a technique used by developers whereby the public key is added
9		to the assembly name as before, granting the assembly its unique identity, but no
0		signature is computed. Thus, no private key access is necessary."
1	associating authentication information with said item;	Strong naming the assembly binds the entity's/publisher's name into the
2		assembly. The public portion of the key used to strongly name the assembly is
3	·	placed in the assembly manifest. Other assemblies or applications can contain
4		references to the strong names of strongly named assemblies such as in the case of
.5		applications that contain references to a set of compliant .NET core libraries. Strong naming compliant .NET core libraries with
26		the European Computers Manufactures Association's (ECMA) key is a way to
27	·	allow any publisher to develop compliant  NET core libraries that can be
28		

293482.02

1		
1		NET O I D I I I I I I I I I I I I I I I I I
2		.NET Security Framework - pg 124 "Strong naming is a process whereby an
3		assembly name can be further qualified by
3		the identity of the publisher."
4		NET Security Framework – pg 133 The publisher must advertise its public key
_		or keys in an out-of-band fashion (such as
5		documentation shipped with the product or
6		on the company Web site)
_		NET Security Framework - pg 130 The goal of the ECMA key is to allow a
7	·	slightly more generalized strong name
8		binding than usual, namely allowing
		binding to the publisher of the runtime in use, rather than to a fixed publisher.
9	incorporating said item into a secure digital	Signing the assembly places it in a secure
10	container;	container.
		NET Framework Security – pg 527 Strong named assemblies cannot be
11		modified in any manner without destroying
12		the strong name signature.
		Applied Microsoft .NET Framework Programming - pg 89
13		Strongly Named Assemblies Are Tamper-
14		Resistant
!	·	When the assembly is installed into the GAC, the system hashes the contents of the
15	·	file containing the manifest and compares
16		the hash value with the RSA digital
		signature value embedded within the PE file (after unsigning it with the public key).
17		If the values are identical, the file's
18		contents haven't been tampered with and
		you know that you have the public key that corresponds to the publisher's private key.
19		In addition, the system hashes the contents
20		of the assembly's other files and compares
		the hash values with the hash values stored in the manifest file's FileDef table. If any
21		of the hash values don't match, at least one
22		of the assembly's files has been tampered
		with and the assembly will fail to install into the GAC.
23	associating a first rule with said secure	A .NET assembly includes imperative and
24	digital container, said first rule at least in	declarative statements/rules that will
	part governing at least one aspect of access to or use of said item;	govern its access or use. For example, role-based security or strong name
25	to or use or said item,	demands in the assembly can be the first

#### INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP. INTERTRUST INFRINGEMENT CHART

INTERTRUST INTRINGENIENT COA	
FOR U.S. PATENT NO. 6,253,193	

3	CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
4		
 5	19.	Infringing products include Office 2003 and included applications, and Server 2003,
6		including Microsoft hosted RMS Service using Passport
	A method comprising:	
7	receiving a digital file at a first device;	Receiving a digital file such as a Word
8		Document, email, Excel spreadsheet, PowerPoint presentation, or other content at a recipient's device. Such content may be
9		received via email, received on removable
10		media, such as floppy disk, downloaded and viewable by Internet Explorer, e.g., a web page possibly containing graphics and/or audio data,
11		etc.
12	establishing communication between said first device and a clearinghouse located at a	If the digital file is subject to rights management, and the recipient tries to open the
13	location remote from said first device;	digital file in an IRM-enabled application, the IRM-enabled application contacts a remote RMS, i.e., clearinghouse for a use license.
14	said first device obtaining authorization	If the recipient is authorized to access or use
15	information including a key from said clearinghouse;	the digital file, the RMS creates a license for the digital file. The RMS then seals a key
16	•	inside the license so that only the recipient canaccess or use the digital file. Finally, the RMS sends the license back to the recipient.
17	said first device using said authorization	The recipient's device then uses the key in the
18	information to gain access to or make at least one use of said first digital file, including	license to gain access or decrypt a portion of the digital file.
19	using said key to decrypt at least a portion of said first digital file; and	
20	receiving a first control from said	The license received from the RMS at the recipient's device contains at least one control,
21	clearinghouse at said first device;	such as restricting the ability to print, forward, or edit.
22	storing said first digital file in a memory of said first device;	The digital file is stored in the memory of the said recipient's device, such as in RAM, on a
23	16 11 11 11 11 11	hard drive, etc.
24	using said first control to determine whether said first digital file may be copied and stored on a second device;	The at least one control in the license limits copying the digital file.
25	on a second device,	Such controls are set when the digital file was
26		authored. For example, when the digital file is authored, the IRM-enabled application
27		presented the author with a list of policy templates with different rights levels. The
28		author selected an appropriate rights level which may for instance, allow other users in the
		system to open and read the document, but not
	· ::	•

1		
2		to modify it, copy text from it, or forward it. These rights or controls are then associated with the digital file.
3 4 5		When an attempt is made to access the digital file, the RMS determines the recipient's rights based on the recipient's identity and the policies or controls associated with the digital file.
6 7	if said first control allows at least a portion of said first digital file to be copied and stored on a second device,	If the control in the license allows copying the digital file to a second device, then at least a portion of the digital file is copied,
8	copying at least a portion of said first digital file;	such as by transferring or forwarding the digital file in an email message;
9	transferring at least a portion of said first digital file to a second device including a memory and an audio and/or video output;	A portion of the digital file is then transferred to a second device, such as a personal computer or portable device. The second device includes a memory and an audio and/or video output.
11		The memory may be a hard-drive, RAM, CD, DVD, or other storage. The audio and/or video
12		output may be speakers and/or a video monitor.
13	storing said first digital file portion in said memory of said second device; and	The digital file is stored in the second device's memory.
14 15	rendering said first digital file portion through said output.	The digital file is rendered through the output, such as played through the speakers and/or displayed on the video monitor. For example, a
16		Word document is displayed on the screen of
• •	l	the video monitor.
17		the video monitor.
		the video monitor.
17		the video monitor.
17 18		the video monitor.
17 18 19		the video monitor.
17 18 19 20 21 22		the video monitor.
17 18 19 20 21 22 23		the video monitor.
17 18 19 20 21 22 23 24		the video monitor.
17 18 19 20 21 22 23 24 25		the video monitor.
17 18 19 20 21 22 23 24 25 26		the video monitor.
17 18 19 20 21 22 23 24 25 26 27		the video monitor.
17 18 19 20 21 22 23 24 25 26		the video monitor.

# INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP. INTERTRUST INFRINGEMENT CHART FOR U.S. PATENT NO. 5,949,876

. 3	FOR U	J.S. PATENT NO. 5,949,876
4.		
5	2.	Infringement is based on Microsoft's Visual Studio .NET and/or the .NET Framework licensing tools (in
6		the.NET Framework SDK) and/or Microsoft Installer SDK
7	A system for supporting electronic commerce including:	
8	means for creating a first secure control set at a first location;	The first location is a .NET component developer's site.
9		The first secure control set is the set of declarative statements comprising the <i>LicenseProviderAttribute</i> of
10		a first .NET licensed component that provides for a design-time license to use the control. This attribute
11		also specifies the type of license validation that occurs.  The component is encapsulated in a signed .NET
12	means for creating a second secure	The second location is the .NET application
13	control set at a second location;	developer's site where a .NET application comprising one or more assemblies is created.
14		The second secure control set comprises the
15		declarative statement(s) (including licensing statements, and code access security statements) of a
16		signed .NET assembly using or calling the first .NET component. The control set can include a set of
17	-	security permissions demanded by the .NET assembly containing the licensed component, whereby the
18		permissions are demanded of components that call the application components. The control set can also be
19		extended by controls expressed as conditional syntax statements in a signed .msi file containing a click
20		through end-user license (the end-user license scenario).
21	means for securely communicating said first secure controller from said first	The first .NET control set is securely communicated from the first location developer to the .NET solution
22	location to said s Ad location; and	provider by either being contained in a signed assembly, within a signed cabinet file or within a
23	means at said second location for	signed .msi file.  At the second location, the solution developer uses the
24	securely integrating said first and second control sets to produce at least a	.NET runtime that includes the LicenseManager.
25	third control set comprising plural elements together comprising an	Whenever a class (control or component) is instantiated (here, an instance of the first .NET
26	electronic value chain extended agreement.	licensed component), the license manager accesses the proper validation mechanism for the control or
27	agreement.	component. A value chain is created through the creation of a run-time license for use of the first .NET
28		component in the context of use of the .NET
		application developed at the second location. The
	"	71

Exhibit E

1

•		
1 2 3		license controls for the runtime license (derived from the design time license) are bound into the header of the .NET application assembly, along with the second control set.
4 5 6 7 8 9 10 11 12 13 14 15 16 17 18		The creation of runtime license controls is securely handled by Visual Studio.NET or the LC tool. Runtime licenses are embedded into (and bound to) the executing assembly. The license control attribute included in the first .NET component is customized in the second location to express and require the runtime license. In a different scenario, the LC tool is used to create a ".licenses file" containing licenses for multiple components, including runtime licenses for components and classes created by the license provider. This .licenses file is embedded into the assembly.  The third control set is an extended value chain agreement that comprises the runtime license controls for the first .NET licensed class (that had been bound to the assembly), the declarative controls provided by the solution provider in the solution provider's assembly, and any runtime licenses for other components included by the solution provider in the solution provider in the solution provider assembly, and any end user license agreement provided by the application provider. The controls are typically integrated into the header of the .NET application assembly calling the first .NET licensed component.  A further "end user licensing scenario" occurs when, at the second location, the application developer packages the application into a signed .msi file that includes conditional syntax statement controls that require that a user read and agree to an end user license agreement for the application and the
19 20	· ·	embedded first component. The third control set includes a plurality of elements that include the runtime licenses mentioned above, security permissions
21		controls, EULA controls (a fourth control set), all securely bound into the signed .msi file.
22		
23	11. A system as in claim 2 in which said	The Microsoft .NET Framework provides a Virtual Distribution Environment. Here the
24	first location and said second location are contained within a Virtual Distribution	nodes are the Common Language Runtime instances that interpret the controls
25 26	Environment.	contained within NET assemblies (among other functions).
26		
28	29. A system as in claim 2 in which said	The licensing control in the first control set
	first secure control set includes required	specifies the method required to validate  Exhibit B

terms.	the license.
32. A system as in claim 2 in which said second secure control set includes required	The security permissions demanded (as described above) are required terms for
terms.	execution of the application code elements.
60. A system as in claim 2 in which said means for securely integrating said first and second control sets includes a fourth	In the scenario where the application assembly is distributed using a signed .msi file, the secure integration of the first and
control set.	second control sets is enhanced by the tamper protection afforded by the signed .msi file. In the end user license scenario, a fourth control set consisting of conditional syntax statements is included in the .msi
	file.
130. A system as in claim 2 further including means for executing said third control set within a protected processing	The third control set is executed under the auspices of the CLR
environment.	
132. A system as in claim 130 in which	The third control set is executed at an end- user site within the CLR.
said protected processing environment is located at a location other than said second location.	user site within the CER.
161. A system as in claim 2 in which said third control set includes controls containing human-language terms corresponding to at least certain of the machine-executable controls contained in said third control set.	In the end user license scenario, the third control set includes a fourth control set that requires that the human user agree with license terms displayed to the user. These human readable terms are referenced in the conditional syntax statement controls contained in the signed .msi file.
162. A method as in claim 161 in which said human-language terms are contained in one or more data descriptor data structures.	The .msi file is a data descriptor data structure.
170. A system as in claim 2 in which said means for creating a first secure control set includes a protected processing environment.	The creation of the first licensed component, including its licensed controls is carried out under the auspices of the CLR.
171. A system as in claim 2 in which said means for creating a second secure control set includes a protected processing environment.	The application design time environment and the creation of the .NET application is carried out under the auspices of the CLR.
172. A system as in claim 2 in which said means at said second location for securely integrating includes a protected processing environment.	The means for integrating the runtime license with the application controls is carried out under the auspices of the CLR.
329. A system as in claim 2 in which said	VS.NET runs under Windows.

1		
2	means for creating a first secure control set includes an operating system based on or compatible with Microsoft Windows.

## INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP. INTERTRUST INFRINGEMENT CHART FOR U.S. PATENT NO. 6,389,402

3		··
4	CLAIM LANGUAGE	CLAIM OF INFRINGEMENT:
5	1.	Products infringing: Microsoft Visual Studio .NET, .NET License Compiler, .NET Framework SDK, and .NET Common Language Runtime
7	A method including	A method for producing a third .NET
8		component (application) that incorporates first and second .NET component whose distribution is license controlled.
9	creating a first secure container including a	The first secure container is a first signed
10 11	first governed item and having associated a first control;	.NET component that includes a license control. The governed item is the .NET component.
12	·	The first control is the set of declarative statements comprising the
13		LicenseProviderAttribute of a first .NET licensed component that provides for a design-
14 15		time license to use the control. This attribute also specifies the type of license validation that occurs.
16	creating a second secure container including a	The second secure container is the second
17	second governed item and having associated a second control;	signed .NET component that includes a license control. The governed item is the .NET component.
18		· · · · · · · · · · · · · · · · · · ·
19		The second control is the set of declarative statements comprising the LicenseProviderAttribute of a second .NET
20 21		licensed component that provides for a design- time license to use the control. This attribute also specifies the type of license validation that
		occurs.
22	transferring the first secure container from a	The creator distributes a signed and licensed
23	first location to a second location;	.NET component.
24		An application developer at a second location downloads a first .NET component for
25	. ,	inclusion into an application.
26	transferring the second secure container from a	A creator distributes a signed and licensed
27	third location to the second location;	.NET component from a different location.
28		Application developer downloads a second .NET component for inclusion into an application.

at the second location, obtalleast a portion of the first gaccess being governed at lefirst control;	governed item, the	At the second location, the application developer uses the .NET runtime that includes the LicenseManager to access a first governed item.  Whenever a class (control or component) is instantiated (here, an instance of the first .NET licensed component), the license manager accesses the proper validation mechanism for the control or component.
		The first control comprises the declarative statement(s) (including licensing statements, and code access security statements) of the first .NET component.
at the second location, obtalleast a portion of the second access being governed at lesecond control;	d governed item, the	At the second location, the application developer uses the .NET runtime that includes the LicenseManager to access a second governed item.  Whenever a class (control or component) is
	·	instantiated (here, an instance of the second .NET licensed component), the license
		manager accesses the proper validation mechanism for the control or component.
	·	The second control comprises the declarative statement(s) (including licensing statements, and code access security statements) of the
at the second location, crea container including at least governed item and at least	a portion of the first a portion of the	second .NET component.  At the second location, the application developer uses the .NET runtime that includes the LicenseManager to access a first governed
second governed item and least one control, the creati at least in part by the first c	on being governed	item and second governed item to construct an application, the third secure container.
second control.		Creation governance is accomplished by invoking the .NET runtime to access the first governed item and the second governed item.
		Whenever a class (control or component) is instantiated the license manager accesses the
		proper validation mechanism for the control or component.
		The portions of the first governed item and second governed item that are being included
		in the third secure container will typically include the governed items themselves, ie. the .NET components.
